

Video Walkthrough Transcript

Presenter: Sage (@metathesage)

Live Application: [arcsplit-two.vercel.app](#) · **Repository:** [github.com/metathesage/arcsplit](#)

Target duration: 3:30 – 4:45 · **Contracts:** Arc Mainnet 0x57B02Be99573B4aD4d744278821932f5b8742535 · Arc Testnet 0x3B31124377078eE939786e2765e1820Ad2C96399

FULL NARRATION TRANSCRIPT

"Hello Circle Grant Committee, my name is Sage (@metathesage), and today I am excited to present ArcSplit: the programmable, non-custodial party USDC payment rail built specifically for Circle's Arc Network. On legacy blockchains like Ethereum, Arbitrum, or Base, splitting revenue across multiple recipients is cumbersome. Payers must hold volatile gas tokens like ETH, submit an ERC-20 `approve()` transaction, and pay duplicate changes this fundamentally because USDC is the native gas token. ArcSplit harnesses this architecture to deliver atomic, single-hop payment splits with zero token approval transactions, sub-second finality, and sub-cent fees. Today we will walk through the smart contract code, inspect our live deployments, and demonstrate the production dApp." "Let's look at `contracts/ArcSplit.sol`. Here, in the `splitNative()` function, you can see how the native USDC gas model changes the developer experience. Instead of transferring ERC-20 tokens with prior allowances, the function receives USDC directly via `msg.value`. It verifies that the recipient addresses are valid, checks that the basis points sum to exactly 10,000—which represents 100.00%—and performs direct, low-level calls to forward funds to all recipients in a single atomic transaction. Notice our mathematical precision guarantee: any fractional remainder resulting from integer division is automatically forwarded to the primary recipient, guaranteeing zero trap funds. Next, opening `src/config/constants.js`, we can see our live deployed contracts: Both contracts are verified and confirmed on the Arc Block Explorer. "Now let's switch to the live dApp at `arcsplit-two.vercel.app`. Notice our high-resolution, retro-digital aesthetic with editorial serif typography." 5. "With this grant, we are expanding our Circle product integrations: Thank you for your time and consideration. We look forward to building out programmable digital dollar payouts on Arc with Circle!"
