

ArcSplit ■ — Investor Deck

- High-voltage, non-custodial multi-party USDC payments on Arc Network
- Tagline: Native USDC gas. Zero approvals. Atomic splits.
- Live: arcsplit-two.vercel.app | Mainnet Chain ID 5042
- Built by @metathesage for the Arc Ecosystem

The Problem — Splitting Money On-Chain is Broken

- Must hold volatile gas token (ETH) just to move stablecoins
- 2-step UX: approve() + transfer() + per-recipient gas
- Unpredictable gas spikes kill micropayments & creator tips
- No native shareable invoice links — manual coordination
- Result: creators, DAOs, startups avoid on-chain revenue share

Why Now — Arc Network Changes Everything

- Circle's stablecoin-native L1 — Mainnet live Sept 16, 2026
- USDC IS the native gas token — no ETH needed
- Sub-second finality, EVM-compatible
- Predictable sub-cent gas paid in fractional USDC
- Backed by Circle + validators: BlackRock, Visa, Mastercard, DTCC
- Ecosystem Day 1: Aave V4, Morpho, Uniswap live

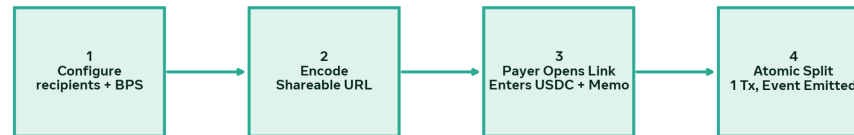

Solution — Meet ArcSplit

- 1-click multi-party USDC splitter and tip jar
- Zero token approvals — send native USDC directly
- Atomic 100.00% precision with basis points (10,000 bps)
- Shareable permalinks: `?split=0xABC:60;0xDEF:40&memo;=PodcastTips`
- On-chain memos & PaymentSplit events for accounting
- Interactive Lightning UI with real-time audio arc synthesis
- Non-custodial, no backend — pure smart contract

How It Works — User Flow

- Step 1: Creator configures recipients + BPS (e.g., 60/30/10)
- Step 2: App encodes into shareable URL / QR / invoice
- Step 3: Payer opens link, enters USDC amount, adds memo
- Step 4: One transaction — atomic split, remainder to primary, event emitted
- No approvals, no wrapped tokens, no locked funds

How It Works — 3 Seconds From Link to Split

Smart Contract — ArcSplit.sol

- Core: splitNative(recipients, basisPoints, memo) payable
- Validates sum == 10000 bps, non-zero addresses
- Direct call{value: share} passthrough — gas efficient
- Rounding remainder auto-routed to primary recipient
- Secondary: splitERC20 for any ERC-20 support
- Compiled vialR true, 200 optimizer runs

Live Deployment — Mainnet & Testnet Ready

- Arc Mainnet: 0x57B02Be99573B4aD4d744278821932f5b8742535 | Chain 5042 | rpc.mainnet.arc.io
- Arc Testnet: 0x3B31124377078eE939786e2765e1820Ad2C96399 | Chain 5042002 | rpc.testnet.arc.io
- Live dApp: arcsplit-two.vercel.app — In-browser 1-click deployer
- CLI deploy: `node scripts/deploy.cjs --network mainnet`
- Vercel hosted, wallet connect: MetaMask, Rabby, Coinbase Wallet

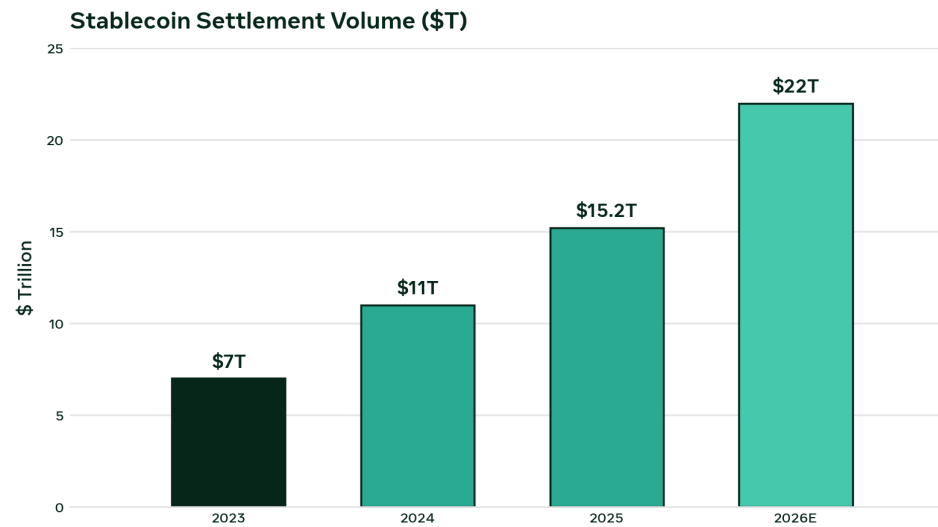

Use Cases — Who Needs This?

- Creator Tip Jars: Podcasts, streams, open-source with co-host splits
- Startup & DAO Payroll: Co-founder revenue share, contributor payouts
- Affiliate & Referral: Atomic affiliate commissions on invoice settlement
- Invoicing: Freelancers encode splits to agency + subcontractors
- Charity Splits: Donation automatically divided across causes
- Enterprise Treasury: Stablecoin disbursements with on-chain audit trail

Market Opportunity

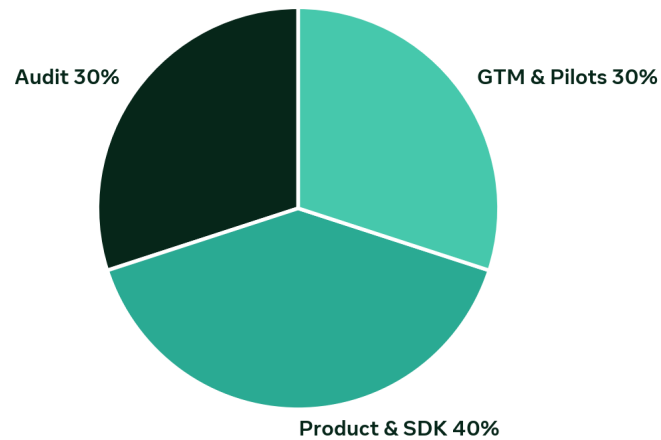

- Stablecoin settlement > \$15T annualized in 2025, USDC \$6T+
- Creator economy: \$250B, 50M+ creators need monetization tools
- On-chain invoicing & payroll growing 80% YoY with remote DAOs
- Arc Network positioned as financial L1 — first-mover advantage for native USDC tooling

Business Model

- Free: Public contract, unlimited splits, sub-cent gas only
- Premium: 25-50 bps fee on enterprise dashboard, invoicing, analytics
- ArcSplit Pro: Team management, recurring splits, API, webhooks
- White-label SDK for platforms (podcast hosts, marketplaces)
- Transaction volume = revenue flywheel as Arc TVL grows

Use of Funds — \$300K Pre-Seed

Competitive Edge

- Native vs Wrapped: Uses Arc's native USDC gas — no approvals
- Precision: 100.00% BPS enforcement, no dust locked
- Shareability: Permalink invoice encoding — no competitor does this
- UX: Lightning scene, 1-click, mobile-friendly
- Lean: Single file contract <200 lines, fully auditable

Competitive Edge — Native vs Wrapped

Feature	ArcSplit (Arc)	OxSplits / Base	Superfluid
Gas Token	USDC (native)	ETH (volatile)	ETH (volatile)
Approvals	Zero	ERC20 approve()	approve() + stream
Gas Predictability	Sub-cent USDC	Spikes	Spikes
Shareable Link	Yes ?split=	No	No
Precision	100.00% BPS	Dust risk	Flow rounding

Go-To-Market

- Launch on Arc ecosystem hub + Circle grant kit (grant-kit/ included)
- Creator partnerships: 10 pilot podcasts / streamers with split tip jars
- Integration: Offer widget for Paragraph, Bonfire, Patreon alternatives
- Dev tooling: NPM SDK for ?split= params parsing
- Viral loop: Every invoice is a shareable ad for ArcSplit

Roadmap

- Q4 2026: Security review, mainnet hardening, analytics dashboard, recurring splits
- Q1 2027: ArcSplit Pro (team, API, webhooks), ERC-20 fee switch
- Q2 2027: Cross-chain via CCTP — receive on Base, settle on Arc
- Q3 2027: White-label SDK, enterprise invoicing, tax export
- Vision: Default payment rail for multi-party USDC on Arc

Team & Ask

- Architect & Developer: @metathesage — full-stack Web3, Arc early builder
- Why him: Shipped live dApp + contracts on both mainnet/testnet in <2 weeks
- Ask: \$300K pre-seed / Circle ecosystem grant + angels
- Use of Funds: Audit (30%), Product & SDK (40%), GTM & creator pilots (30%)
- Contact: GitHub metathesage/arcsplit — Demo arcsplit-two.vercel.app
