

ArcSplit

— The problem

Splitting money on-chain is broken

Must hold volatile gas token (ETH) just to move stablecoins — UX and treasury nightmare.

2-step dance: `approve()` + `transfer()` + per-recipient gas. Micropayments die to fees.

Unpredictable gas spikes kill creator tips, payroll, and <\$10 payouts.

No native shareable invoice links — manual coordination, spreadsheets, errors.

result on legacy chains

Creators avoid revenue share

Arc Network **changes** everything

- **USDC is the native gas token** — no ETH needed, no approvals. Pay gas in fractional USDC.
- **Sub-second finality**, EVM-compatible, predictable sub-cent fees built for finance.
- **Backed by Circle +** BlackRock, Visa, Mastercard, DTCC validators at launch.
- **Ecosystem Day 1:** Aave V4, Morpho, Uniswap live. Chain ID 5042 — purpose-built for financial apps.

LIVE MAINNET • SEPT 16, 2026

USDC = gas

Circle's stablecoin-native L1. No volatile gas token. The thesis ArcSplit was built for.

Day-1 DeFi ecosystem

Meet ArcSplit

1-click USDC splitter

High-voltage, non-custodial multi-party payments on Arc. Native USDC gas. Zero approvals. Atomic splits.

 **Zero approvals** — send native USDC directly, no wrapped tokens, no allowance dance.

 **100.00% BPS precision** — 10,000 basis points enforced, remainder auto-routed to primary, no dust locked.

 **Shareable permalinks** — ?split=0xABC:60;0xDEF:40&memo= encoding for invoices, QR, tip jars.

 **Lightning UI + on-chain memo** — interactive audio arc synthesis, PaymentSplit events for accounting.

SHAREABLE INVOICE LINK

From link to split

— HOW IT WORKS

From link to split in 3 seconds

No approvals, no wrapped tokens, no locked funds. One atomic transaction — shareable permalink does the coordination.

How It Works — 3 Seconds From Link to Split

Smart contract — lean, auditable, built for Arc

ArcSplit.sol • <200 lines

src/contracts/ArcSplitData.json • vialR true • 200 runs

Core — splitNative

```
function splitNative(address[] recipients, uint16[] basisPoints, string memo) external payable
```

Direct native USDC passthrough. No wrapped tokens, no approvals, no custody. One tx atomic split.

payable

non-custodial

atomic

Precision — 100.00% BPS

Validates **sum == 10,000 bps**, non-zero addresses. Rounding remainder auto-routed to primary — no dust locked, ever.

require(sum==10000)

dust → primary

Gas-efficient by design

Direct **call{value: share}** passthrough. No loops over storage, no proxy, no upgrade risk. Sub-cent USDC gas on Arc.

vialR true

optimizer 200

call passthrough

Events & ERC-20 fallback

PaymentSplit & memo emitted for accounting. Secondary **splitERC20** for any token.

Stablecoin payments are **exploding**

Arc Network positioned as financial L1 — first-mover advantage for native USDC tooling. ArcSplit captures the multi-party distribution layer.

Stablecoin settlement volume

USDC \$6T+ of total

CORE TAILWIND • 2025

\$15.2T settlement

\$15T annualized in 2025, \$22T expected 2026E. USDC \$6T+. On-chain dollars overtaking legacy rails.

\$250B

Creator economy — 50M+ creators need monetization, tip jars, revenue share without ETH gas.

80% YoY

On-chain invoicing & payroll growth with remote DAOs. Arc TVL = ArcSplit volume flywheel.

Freemium protocol, premium SaaS

Free for anyone to split. Revenue scales with Arc TVL — transaction volume becomes the flywheel as stablecoin payments explode.

LIVE NOW

Free — public good

Public contract, unlimited splits. No fees, no limits. User pays only sub-cent USDC gas. Non-custodial, no backend — drives adoption and distribution.

0 bps

Protocol fee on core splits

 Every invoice is an ad — viral link loop

Premium take rate

25–50 bps on enterprise dashboard: invoicing, analytics, recurring splits, tax export.

25–50

bps on Pro volume

Flywheel

As Arc TVL grows → more splits → more data
→ more Pro conversions.

ArcSplit Pro

Team management, recurring splits, API, webhooks. Built for startups, DAOs, and treasury ops that need audit trails.

- ✓ White-label SDK for podcast hosts & marketplaces
- ✓ Roles, approvals, multi-sig ready
- ✓ CCTP bridging: receive on Base, settle on Arc

Why ArcSplit **wins** on Arc

Native USDC gas unlocks a UX impossible on ETH L1s. Competitors need wrapped tokens & approvals — we don't.

Native vs wrapped — zero approvals

Uses Arc's native USDC as gas. Oxsplits & Superfluid on Base/ETH need ERC20 approve() + gas spikes.

100.00% BPS precision — no dust

Enforces 10,000 bps total. Remainder auto-routed to primary. No funds locked.

Shareable permalink — only on ArcSplit

?split=0xABC:60;0xDEF:40&memo= encoding. Every invoice is a viral loop. No competitor does this.

Lean & Arc-aligned — <200 lines

Single-file, fully auditable, no upgrade proxy. Circle ecosystem grant-ready.

Competitive Edge — Native vs Wrapped

Feature	ArcSplit (Arc)	Oxsplits / Base	Superfluid
Gas Token	USDC (native)	ETH (volatile)	ETH (volatile)
Approvals	Zero	ERC20 approve()	approve() + stream
Gas Predictability	Sub-cent USDC	Spikes	Spikes
Shareable Link	Yes ?split=	No	No
Precision	100.00% BPS	Dust risk	Flow rounding

USDC native

Gas token = stable, predictable

?split=
